

Lab 12: Recursion

Due: Friday 4/21 at 11:59 PM

For this lab you are to write two recursive functions. The two problems have nothing to do with each other, so you should do the easy one first and test it, and then tackle the second one. The functions are to be recursive, meaning that there will be no “while” or “for” anywhere in the program except where I have shown it in the main below. **No credit will be given for a non-recursive solution.**

Problem One: Write a recursive function, called *counting*, that receives a single parameter which will always be a positive number and then prints all the even numbers from 0 up to, and including the number that was passed in, if that number is even, or one less than the number passed in if it is odd. (“Up to” means that you start with the smallest number and end with the largest number.)

Run with the program with the values 23, 18, and -2. (No output should be generated by the last.)

The main for this program will look like this:

```
int main() {
    int x;
    for(int j = 0; j < 3; ++j){
        cout << "Enter a number: ";
        cin >> x;
        cout << "The even numbers counting up to there:\n";
        counting(x);
    }
    // main for Part Two will go here

    return 0;
}
```

The function that you are to implement is:

```
int counting(int n);
```

Problem Two: For this part, you need to write a recursive function which takes an integer n as input, printing a pattern of n lines of asterisks. The first line contains one asterisk, the next line contains two and so on up to the n th line which contains n asterisks. Line number $n+1$ again contains n asterisks, the next line has $n-1$ asterisks, the next line $n-2$, and so on until the line $2n$, which will have just one asterisk. The main function is provided.

```
// helping function of see_stars to print stars
// should print n stars on the same line
// needs to be recursive
void print_stars(int n);

// calls print_stars in the body; also needs to be recursive
void see_stars(int count, int stop);

// add to the main
int n;
cout << "Enter a number between 1 and 30 to see the stars\n";
cin >> n;
see_stars(1, n);
```

Sample output:

Enter a number between 1 and 30 and see the stars.

Submit your source code showing all three recursive functions, the main that calls them, and the script file that shows a complete running of the program to Blackboard.
